1. USB Core Library Overview

The USB Core library is composed of four major parts, which are OHCI driver, EHCI driver, USB driver, and USB hub device driver. Each of these four drivers also represents one of the three-layered USB driver layers. Figure 1-1 presents the driver layers of the USB library.

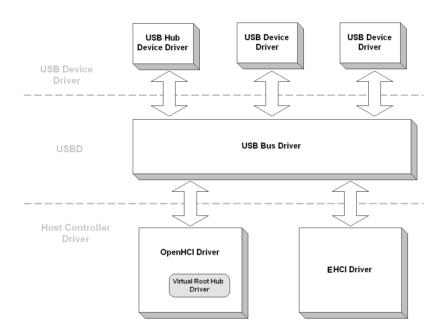

Figure 1-1: USB driver layers of the USB library

NO:	USB Host Core Library	VERSION:	1.0	PAGE:	4

2. Data Structures

The USB Core library has included many complicated data structures to describe a USB bus, a device, a driver, various descriptors, and so on. To realize these data structures may be necessary for a USB device driver designer. In the following sections, we will introduce all data structures you may need. These data structures are all defined in header file <usb.h>.

2.1 USB DEV T

USB_DEV_T is the data structure used to represent a device instance. Once the host finds that a device presented on a USB bus, the USB system software is notified. The USB system software resets and enables the hub port to reset the device. It then creates a **USB_DEV_T** for the newly detected device. For each USB device presented on the bus, even the same device type, USB system software will create a **USB_DEV_T** to represent it as an instance.

The contents of all members of **USB_DEV_T** are automatically assigned by USB system software. The USB system software will assign a unique device number, read device descriptor and configuration descriptors, and create parent/child relationships. The definition of USB_DEV_T is listed below, and the detailed descriptions can be found in Table 2-1.

```
typedef struct usb device
    INT
            devnum;
    INT
            slow;
    enum
            USB SPEED UNKNOWN = ,
            USB SPEED LOW,
            USB SPEED FULL,
            USB SPEED HIGH
            speed;
    struct usb tt *tt;
    INT
           ttport;
    INT
            refcnt;
    UINT32 toggle[2];
```

```
UINT32 halted[2];
INT epmaxpacketin[16];
INT epmaxpacketout[16];
struct usb_device *parent;
INT hub_port;
USB_BUS_T *bus;
USB_DEV_DESC_T descriptor;
USB_CONFIG_DESC_T *config;
USB_CONFIG_DESC_T *actconfig;
CHAR **rawdescriptors;
INT have_langid;
INT string_langid;
VOID *hcpriv;
INT maxchild;
struct usb_device *children[USB_MAXCHILDREN];
} USB_DEV_T;
```

Table 2-1: Members of USB_DEV_T

Member	Description
devnum	Device number on USB bus; each device instance has a unique device number
slow	Is low speed device speed ? (1: yes; 0: no)
speed	Device speed
refcnt	Reference count (to count the number of users using the device)
toggle[2]	Data toggle; one bit for each endpoint ([0] = IN, [1] = OUT)
halted[2]	Endpoint halts; one bit for each endpoint ([0] = IN, [1] = OUT)
epmaxpacketin[16]	IN endpoints specific maximum packet size (each entry represents for an IN endpoint of this device)
epmaxpacketout[16]	OUT endpoints specific maximum packet size (each entry represents for an OUT endpoint of this device)
parent	Parent device in the bus topology (generally, it should be a hub)
bus	The bus on which this device was presented
descriptor	Device descriptor
config	All of the configuration descriptors

actconfig	The descriptor of the active configuration
rawdescriptors	Raw descriptors for each configuration descriptor (driver can find class specific or vendor specific descriptors from the <i>rawdescriptors</i>)
have_langid	Whether string_langid is valid yet
string_langid	Language ID for strings
hcpriv	Host controller private data
maxchild	Number of ports if this is a hub device
children[]	Link to the downstream port device if this is a hub device

2.2 Descriptor Structures

In the **USB_DEV_T** structure, device descriptor, configuration descriptors, and raw descriptor are included. The USB Driver will acquire these descriptors from device automatically while the device is probed. The USB Driver issues GET_DESCRIPTOR standard device request to acquire the configuration descriptors. It also parses the returned descriptors to create configuration-interface-endpoint descriptor links. Client software can obtain any configuration, interface, or endpoint descriptors by tracing the descriptor link started from **USB_DEV_T**. As USB Driver cannot understand class-specific and vendor-specific descriptors, it does not create link for these descriptors. If the client software wants to obtain any class-specific or vendor-specific descriptors, it can parse the descriptors stored in raw descriptor, which is the original descriptors list returned from the device. Table2-2, Table 2-3, Table 2-4, and Table 2-5 describe the structures defined for device descriptors, configuration descriptors, interface descriptors, and endpoint descriptors, respectively.

Figure 2-1 presents an overview on the relationship of these data structures. From <code>USB_DEV_T</code> (device instance structure), <code>USB_DEV_DEC_T</code> (device descriptor structure) and <code>USB_CONFIG_DEC_T</code> (configuration descriptor structure), <code>USB_IF_DESC_T</code> (interface descriptor structure), to <code>USB_EP_DESC_T</code> (endpoint descriptor structure), all structure entries are linked in top-down order.

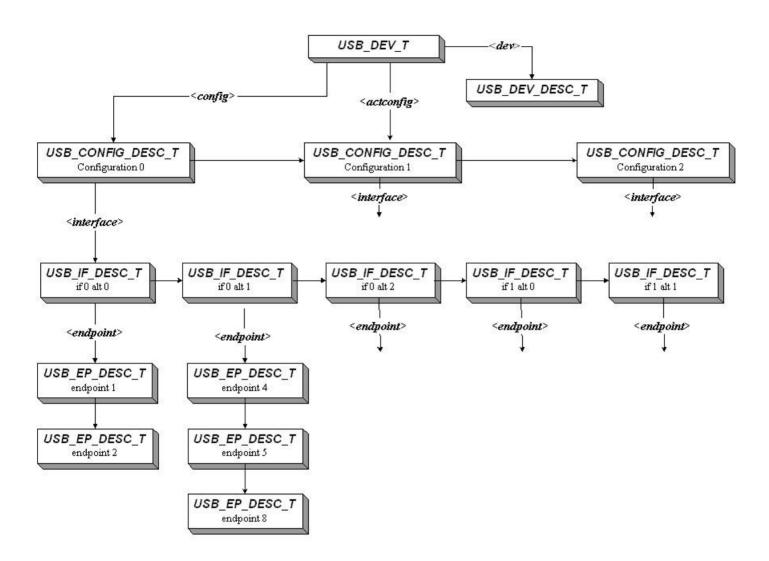

Figure 2-1 Descriptors relationship

NO:	USB Host Core Library	VERSION:	1.0	PAGE:	8

```
__packed UINT8 bDeviceProtocol;
__packed UINT8 bMaxPacketSize0;
__packed UINT16 idVendor;
__packed UINT16 idProduct;
__packed UINT16 bcdDevice;
__packed UINT8 iManufacturer;
__packed UINT8 iProduct;
__packed UINT8 iSerialNumber;
__packed UINT8 bNumConfigurations;
} USB_DEV_DESC_T;
```

Table 2-2: Members of USB_DEV_DESC_T

Member	Description
bLength	Size of the descriptor in bytes
bDescriptorType	DEVICE descriptor type (0x01)
bcdUSB	USB specification release number in BCD format
bDeviceClass	Device class code
bDeviceSubclass	Device subclass code
bDeviceProtocol	Protocol code
bMaxPacketSize0	Maximum packet size for endpoint zero
idVendor	Vendor ID
idProduct	Product ID
iManufacturer	Device release number in BCD format
iProduct	Index of string descriptor describing product
iSerialNumber	Index of string descriptor describing the serial number
bNumConfigurations	Number of possible configurations

You may have found that the definition of **USB_DEV_DESC_T** is fully compliant to the definition of device descriptor defined in USB 1.1 specification. In fact, the USB Driver acquires the device descriptor and fills it into this structure without making any modifications.

Table 2-3: Members of USB_CONFIG_DESC_T

Member	Description
bLength	Size of the descriptor in bytes
bDescriptorType	CONFIGURATION descriptor type (0x02)
wTotalLength	The total length of data returned for this descriptor
bNumInterfaces	Number of interface supported by this configuration
bConfigurationValue	Value to use as an argument to the SetConfiguration() request to select the active configuration
iConfiguration	Index of string descriptor describing this configuration
bmAttributes	Bitmap describing the configuration characteristics
MaxPower	Maximum power consumption of the USB device from the bus in this specific configuration when the device is fully operational (in mA)
interface	Refer to the interface descriptor list (recorded in USB_IF_DESC_T structure format) returned by this configuration
extra	Refer to the memory buffer preserve the raw data of this configuration descriptor itself
extralen	The length of the <extra> memory buffer</extra>

NO: USB Host Core Library VERSION: 1.0 PAGE: 10	NO:	USB Host Core Library	VERSION:	1.0	PAGE:	10
---	-----	-----------------------	----------	-----	-------	----

The *dev->config* refers to a list of configurations supported by this device. Client software can access any configuration by indexing the configuration, for example, dev->config[0] is referred to the first configuration of this device. While <*config>* of *USB_DEV_T* refers to the configuration list, <*actconfig>* refers to the currently activated configuration. There can be only one configuration activated at the same time.

The structure members from *bLength* to *MaxPower* are fully compliant to that defined in USB 1.1 specification. The *interface* refers to a list of interfaces supported by this configuration. In addition, USB Driver keeps the interface descriptor itself in a dynamically allocated memory buffer, which is referred to by *extra*, and the length of this memory buffer is *extralen*.

An interface may contain several alternate settings. Each alternate setting has its own set of endpoints. USB Driver creates a single **USB_IF_DESC_T** structure for each alternate interface setting and links them in the order that they presented in the returned data of a configuration descriptor.

```
/* Interface descriptor */
typedef struct usb interface descriptor
    __packed UINT8 bLength;
   packed UINT8 bDescriptorType;
    packed UINT8 bInterfaceNumber;
    packed UINT8 bAlternateSetting;
    packed UINT8 bNumEndpoints;
     packed UINT8 bInterfaceClass;
     packed UINT8 bInterfaceSubClass;
   __packed UINT8 bInterfaceProtocol;
     packed UINT8 iInterface;
   USB EP DESC T *endpoint;
   UINT8 *extra;
   INT
         extralen;
} USB IF DESC T;
```

Table 2-4: Members of USB_IF_DESC_T

Member	Description
bLength	Size of the descriptor in bytes

NO: USB Host Core Library VERSION: 1.0 PAGE: 1	NO:	USB Host Core Library	VERSION:	1.0	PAGE:	11
--	-----	-----------------------	----------	-----	-------	----

bDescriptorType	INTERFACE descriptor type (0x04)
bInterfaceNumber	Number of interface. Zero-based value identifying the index in the array of concurrent interfaces supported by this configuration.
bAlternateSetting	Value used to select alternate setting for this interface
bNumEndpoints	Number of endpoints used by this interface (excluding endpoint zero)
bInterfaceClass	Class code
bInterfaceSubClass	Subclass code
bInterfaceProtocol	Protocol code
iInterface	Index of string descriptor describing this interface
endpoint	Refer to the endpoint descriptor list (recorded in USB_EP_DESC_T structure format) of this interface returned by this configuration
extra	Refer to the memory buffer preserve the raw data of this interface descriptor itself
extralen	The length of the <extra> memory buffer</extra>

The *dev->config[n]->interface* refers to a list of interfaces supported by configuration n. The structure members from *<blackblack* to *<iInterface>* are fully compliant to that defined in USB 1.1 specification. The *<endpoint>* refers to a list of endpoints supported by this interface. In addition, USB Driver keeps the interface descriptor itself in a dynamically allocated memory buffer, which is referred to by *<extra>*, and the length of this memory buffer is *<extralen>*.

```
} USB_EP_DESC_T;
```

Table 2-5: Members of USB_EP_DESC_T

Member	Description
bLength	Size of the descriptor in bytes
bDescriptorType	ENDPOINT descriptor type (0x05)
bEndpointAddress	The address of this endpoint
bmAttributes	Transfer type of this endpoint
wMaxPacketSize	The maximum packet size this endpoint is capable of sending or receiving
bInterval	Interval for polling endpoint for data transfers (in milliseconds)
bRefresh	Audio extensions to the endpoint descriptor
bSynchAddress	Audio extensions to the endpoint descriptor
extra	Refer to the memory buffer preserve the raw data of this endpoint descriptor itself
extralen	The length of the <extra> memory buffer</extra>

2.3 DEV_REQ_T

DEV_REQ_T is used to represent the eight bytes device request in a control transfer. All device requests, including standard device requests, class-specific device requests, and vendor-specific device requests, are written in the **DEV_REQ_T** structure, which is also a member of a URB, and transferred to device through the control pipe.

```
typedef struct
{
    __packed UINT8 requesttype;
    __packed UINT8 request;
    __packed UINT16 value;
```

NO:	USB Host Core Library	VERSION:	1.0	PAGE:	13
NO:	USB Host Core Library	VERSION:	1.0	PAGE:	13

```
__packed UINT16 index;
__packed UINT16 length;
} DEV_REQ_T;
```

Table 2-6: Members of DEV REQ T

Member	Description
requesttype	Characteristics of request
request	Specific request
value	Word-sized field that varies according to request
index	Word-sized field that varies according to request
length	Number of bytes to transfer if there is a DATA stage

2.4 USB_DEV_ID_T

When the USB System Software detects a device being attached, it must find out the corresponding device driver for each of its interface from the registered driver list. It can try to invoke the **probe()** routine of each registered device driver for each device interface, but this is not efficient and time-consuming. If the USB System Software can make some simple judgment before trying invoking a device driver, it will be better. This is the purpose of **USB_DEV_ID_T**. The USB Library employ device ID to identify the appropriate device drivers.

When a device driver is registered to USB Driver, it may provide a device ID table, which is structured in **USB_DEV_ID_T** format. In the device ID table, driver can specify the characteristics of the USB device interface that the driver would serve. If a driver does not provide a device ID table, then the USB Driver will always try to invoke it when a new device is detected.

The device driver can use device ID table to specify several checks of characteristics, including vendor ID, device ID, release number, device class, device subclass, device protocol, interface class, interface subclass, and interface protocol. The device driver can specify one or more checks. The more checks are

NO. COB Host Core Library VERSION. 1.0 1 AGE. 14	NO:	USB Host Core Library	VERSION:	1.0	PAGE:	14
--	-----	-----------------------	----------	-----	-------	----

specified, the more specific device interface can be identified. Table 2-7 lists the entries of device ID table.

```
typedef struct usb_device_id
{
    UINT16    match_flags;
    UINT16    idVendor;
    UINT16    idProduct;
    UINT16    bcdDevice_lo;
    UINT16    bcdDevice_hi;
    UINT8    bDeviceClass;
    UINT8    bDeviceSubClass;
    UINT8    bDeviceProtocol;
    UINT8    bInterfaceClass;
    UINT8    bInterfaceClass;
    UINT8    bInterfaceProtocol;
    UINT8    bInterfaceProtocol;
    UINT8    bInterfaceProtocol;
    UINT8    bInterfaceProtocol;
    UINT8    bInterfaceProtocol;
    UINT9    driver_info;
} USB_DEV_ID_T;
```

Table 2-7: Members of USB DEV ID T

Member	Description
matchflag	A bitmask of flags, used to determine which of the following items are to be used for matching
idVendor	Used to compare the vendor ID recorded in device descriptor
idProduct	Used to compare the product ID recorded in device descriptor
bcdDevice_lo	Specify the low limit of device release number
bcdDevice_hi	Specify the high limit of device release number
bDeviceClass	Used to compare the class code in device descriptor
bDeviceSubClass	Used to compare the subclass code in device descriptor
bDeviceProtocol	Used to compare the protocol code in device descriptor
bInterfaceClass	Used to compare the class code in interface descriptor
bInterfaceSubClass	Used to compare the subclass code in interface descriptor
bInterfaceProtocol	Used to compare the protocol code in interface descriptor

	NO:	USB Host Core Library	VERSION:	1.0	PAGE:	15
--	-----	-----------------------	----------	-----	-------	----

There are 10 check items can be used to identify a specific type of device. To select which of these check items should be used to identify a device type is controlled by the < matchflag> member, which is a 16bits bit-mask flag. Each bit of < matchflag> is corresponding to one of these check items. The bit-map definition of < matchflag> is defined as the followings:

```
#define USB DEVICE ID MATCH VENDOR
                                                 0 \times 0001
#define USB DEVICE ID MATCH PRODUCT
                                                 0x0002
#define USB DEVICE ID MATCH DEV LO
                                                 0x0004
#define USB DEVICE ID MATCH DEV HI
                                                 0x0008
#define USB DEVICE ID MATCH DEV CLASS
                                                 0x0010
#define USB DEVICE ID MATCH DEV SUBCLASS
                                                 0x0020
#define USB DEVICE ID MATCH DEV PROTOCOL
                                                 0x0040
#define USB DEVICE ID MATCH INT CLASS
                                                 0x0080
#define USB DEVICE ID MATCH INT SUBCLASS
                                                 0x0100
#define USB DEVICE ID MATCH INT PROTOCOL
                                                 0x0200
```

For convenience of driver implementation, the USB library also provides some useful macros that facilitate the development of device driver. These macros are all listed in the followings, you can also define your own macros:

NO: USB Host Core Library	VERSION:	1.0	PAGE:	16
---------------------------	----------	-----	-------	----

2.5 USB DRIVER T

The USB library has defined a generalized structure for all USB device drivers. To implement a USB device driver based on this library, you must create such a structure and register it to the USB Driver. Once you have registered your device driver, the USB Driver can determine whether to launch your driver when a new device is attached.

As we will give detail introduction to the implementation of USB device driver, we only briefly describe the members of **USB_DRIVER_T** as following:

```
typedef struct usb_device_id
{
    UINT16    match_flags;
    UINT16    idVendor;
    UINT16    idProduct;
    UINT16    bcdDevice_lo;
    UINT16    bcdDevice_hi;
    UINT8    bDeviceClass;
    UINT8    bDeviceSubClass;
    UINT8    bDeviceProtocol;
    UINT8    bInterfaceClass;
    UINT8    bInterfaceClass;
    UINT8    bInterfaceProtocol;
    UINT8    bInterfaceProtocol;
    UINT8    bInterfaceProtocol;
    UINT8    bInterfaceProtocol;
    UINT8    bInterfaceProtocol;
    UINT9    driver_info;
} USB_DEV_ID_T;
```

Table 2-8: Members of USB_DRIVER_T

Member	Description
matchflag	A bitmask of flags, used to determine which of the following items are to be used for matching
idVendor	Used to compare the vendor ID recorded in device descriptor
idProduct	Used to compare the product ID recorded in device descriptor
bcdDevice_lo	Specify the low limit of device release number

bcdDevice_hi	Specify the high limit of device release number
bDeviceClass	Used to compare the class code in device descriptor
bDeviceSubClass	Used to compare the subclass code in device descriptor
bDeviceProtocol	Used to compare the protocol code in device descriptor
bInterfaceClass	Used to compare the class code in interface descriptor
bInterfaceSubClass	Used to compare the subclass code in interface descriptor
bInterfaceProtocol	Used to compare the protocol code in interface descriptor

2.6 URB_T

USB specification has defined four transfer type: control, bulk, interrupt, and isochronous. In the USB library, all these four transfer types are accomplished by URB (USB Request Block). Please refer to Chapter 3 for details about the implementation of each transfer type by using URB.

NO: USB Host Core Library	VERSION:	1.0	PAGE:	18
---------------------------	----------	-----	-------	----

3. Data Transfer

USB specification defines four transfer types, control, bulk, interrupt, and isochronous. The USB device driver performs data transfers by preparing an URB and transfer it to the underlying USB system software. The URBs are designed to be accommodated with all four transfer types. By configuring the URB, USB device driver can specify the destination device interface and endpoint, the data buffer and data length to be transferred, the callback routine on completion, and other detail information. USB device driver passed the URB to the underlying USB system software, which will interpret the URB and accomplish the data transfers by initiating USB transactions between USB Host Controller and the target device endpoint.

URB has been designed to be accommodated with all four USB data transfer types. Due to the characteristics of different transfer types, various requirements must be satisfied to fulfill the transfer. For example, URB contains <code><setup_packet></code> for control transfer, <code><interval></code> for interval transfer, <code><start_frame></code> and <code><number_of_packets></code> for isochronous transfer, and <code><transfer_buffer></code> for all transfers. To implement a USB device driver, the programmers use URBs to accomplish all data transfers to all of the various endpoints.

For a specific endpoint, after delivering a URB to the underlying USB system software, the USB device driver must not deliver another URB to the same endpoint until the current transfer was done by the USB system software. That is, the driver must be blocked in waiting completion of the URB. URB includes a <*complete*> function pointer to solve the block waiting issue. The USB device driver provided a callback function and have <complete> pointer being referred to the callback function. On completion of this URB, the USB system software will invoke the callback function. Thus, the USB device driver was notified with the completion event, and can stop waiting. Note that the callback functions are invoked from an HISR, the execution time must be as short as possible.

3.1 Pipe Control

Before delivering an URB, the USB device driver must determine which device and which endpoint the URB will operate on. This destination device and endpoint is determined by <**pipe**> of URB. <**pipe**> is actually a 32-bits unsigned integer. The USB library defined pipe structure with a 32-bits unsigned integer.

NO:	USB Host Core Library	VERSION:	1.0	PAGE:	19
	,			1	

The USB library has defined several useful macros for pipe control. The pipe is defined as the followings:

31	30	29	28	27	26	25	24
Pipe	Туре	Reserved Speed F		Rese	rved		
23	22	21	20	19	18	17	16
	Reserved Data0/1 Endpoint						
15	14	13	12	11	10	9	8
	Device						
7	6	5	4	3	2	1	0
Direction	Reserved				Max	Size	

Max Size [1 .. 0]

The maximum packet size. This field has been obsoleted. Now the maximum packet size is recorded in <**epmaxpacketin**> and <**epmaxpacketout**> fields of **USB_DEV_T**.

Direction[7]

Direction of data transfer. 0 = Host-to-Device [out]; 1 = Device-to-Host [in]

Device[8 .. 14]

Device number. This is the unique device address, which is assigned by Host Controller driver by **SET_ADDRESS** standard request. With this unique device number, the USB device driver can correctly locate the target device.

Endpoint[15 .. 18]

Endpoint number. This is the endpoint number on the target device, that the pipe is created with. By definition, a pipe corresponds to a unique endpoint on a unique device. By determining the device number and endpoint number, USB device driver can uniquely identify a specific endpoint of a specific device.

Data0/1[19]

Data toggle Data0/Data1. This bit is used to record the current data toggle condition.

NO:	USB Host Core Library	VERSION:	1.0	PAGE:	20

Speed[26]

Endpoint transfer speed. 1 = Low speed; 0 = Full speed.

Pipe Type[30 .. 31]

Transfer type. 00 = isochronous; 01 = interrupt; 10 = control; 11 = bulk.

The USB library has provided a lot of macros facilities for USB device driver designer. The device driver can use the facilities to rescuer the trouble of managing bit fields. These macros are listed in the followings:

Transfer Type

Maximum Packet Size

Direction

Device Number

```
#define usb_pipedevice(pipe) (((pipe) >> 8) & 0x7f)
#define usb_pipe_endpdev(pipe) (((pipe) >> 8) & 0x7ff)
```

Endpoint Number

```
#define usb_pipe_endpdev(pipe) (((pipe) >> 8) & 0x7ff)
#define usb_pipeendpoint(pipe) (((pipe) >> 15) & 0xf)
```

Data Toggle

Speed

```
#define usb_pipeslow(pipe) (((pipe) >> 26) & 1)
```

Pipe Creation

```
static __inline UINT32 __create_pipe(USB_DEV_T *dev, UINT32 endpoint)
{
    return (dev->devnum << 8) | (endpoint << 15) | (dev->slow << 26);
}

static __inline UINT32 __default_pipe(USB_DEV_T *dev)
{
    return (dev->slow << 26);
}</pre>
```

```
/* Create various pipes... */
#define usb sndctrlpipe(dev,endpoint)
           (0x80000000 | create pipe(dev,endpoint))
#define usb rcvctrlpipe(dev,endpoint)
           (0x80000000 | create pipe(dev,endpoint) | USB DIR IN)
#define usb sndisocpipe(dev,endpoint)
           (0x00000000 | create pipe(dev,endpoint))
#define usb rcvisocpipe(dev,endpoint)
           (0x00000000 | create pipe(dev,endpoint) | USB DIR IN)
#define usb sndbulkpipe(dev,endpoint)
           (0xC0000000 | create pipe(dev,endpoint))
#define usb rcvbulkpipe(dev,endpoint)
           (0xC0000000 | create pipe(dev,endpoint) | USB DIR IN)
#define usb sndintpipe(dev,endpoint)
           (0x40000000 | create pipe(dev,endpoint))
#define usb_rcvintpipe(dev,endpoint)
           (0x40000000 | create pipe(dev,endpoint) | USB DIR IN)
#define usb snddefctrl(dev)
          (0x80000000 | default pipe(dev))
#define usb rcvdefctrl(dev)
           (0x80000000 | default pipe(dev) | USB DIR IN)
```

3.2 Control Transfer

IN this section, we will introduce how to make control transfers by URBs. A control transfer is accomplished by sending a device request to the control endpoint of the target device. Depend on the request sent to device, there may be data stage or not.

The URB provided a <**setup_packet**> field to accommodate the device request command. The USB device driver must have the <**setup_packet**> of its URB being referred to an <unsigned char> array, which contained the device request command to be transferred. Note that <**setup_packet**> is designed to be used with control transfer.

If a device request included data stage, the data to be transferred must be referred to by the <**transfer_buffer**> pointer of URB. If the device request required data to be sent from Host to Device, the USB device driver must prepare

NO: USB Host Core Library	VERSION: 1.0	PAGE: 23
---------------------------	--------------	----------

a DMA buffer (non-cacheable) and fill the data to be transferred into this buffer. Then, the USB device driver have <**transfer_buffer**> pointer refer to this buffer, and specify the length of the buffer with <**transfer_buffer_length**> of the URB. If the device requires data to be sent from Device to Host, the USB device driver must prepare a DMA buffer to receive the data from Device. Again, the USB device driver used <**transfer_buffer**> and

<**Transfer_buffer_length**> to describe its DMA buffer. The <actual_length> is written by USB system software to tell the device driver how many bytes are actually transferred.

The USB device driver also has to prepare a callback function to be invoked by the USB system software. The callback function will be invoked on the completion of URB, in spite of success or fail. Generally, the callback function is responsible for waking up the task that delivered the URB. The callback function may also check the status of the URB to determine the transfer is successful or not. The following is an example of control transfer.

```
static VOID ctrl callback(URB T *urb)
    PEGASUS T *pegasus = urb->context;
    switch ( urb->status )
        case USB ST NOERROR:
            if (pegasus->flags & ETH REGS CHANGE)
                pegasus->flags &= ~ETH REGS CHANGE;
                pegasus->flags |= ETH REGS CHANGED;
                update eth regs async(pegasus);
                return;
            }
            break;
        case USB ST URB PENDING:
            return;
        case USB ST URB KILLED:
            break;
        default:
            printf("Warning - status %d\n", urb->status);
    }
```

```
pegasus->flags &= ~ETH REGS CHANGED;
    if (pegasus->flags & CTRL URB SLEEP)
       pegasus->flags &= ~CTRL URB SLEEP;
       NU Set Events(&pegasus->events, 1, NU OR); /* set event */
}
static INT get registers (PEGASUS T *pegasus, UINT16 indx, UINT16 size,
VOID *data)
    INT
         ret;
    UINT8 *dma data;
    while (pegasus->flags & ETH REGS CHANGED)
        pegasus->flags |= CTRL URB SLEEP;
        USB printf("ETH REGS CHANGED waiting...\n");
        NU Retrieve Events (&pegasus->events, 1, NU AND,
                           (unsigned long *)&ret, NU SUSPEND);
    }
    dma data = (UINT8 *)USB malloc(size, BOUNDARY WORD);
    if (!dma data)
        return -ENOMEM;
    pegasus->dr->requesttype = PEGASUS REQT READ;
    pegasus->dr->request = PEGASUS REQ GET REGS;
#ifdef LITTLE ENDIAN
    pegasus->dr->value = 0;
    pegasus->dr->index = indx;
    pegasus->dr->length = size;
#else
    pegasus->dr->value = USB SWAP16(0);
    pegasus->dr->index = USB SWAP16(indx);
    pegasus->dr->length = USB SWAP16(size);
#endif
    pegasus->ctrl urb.transfer buffer length = size;
```

In the above example, the device driver first prepare the device request command in <pegasus->dr>, which was later referred to by <urb->setup_packet>. It request a buffer for DMA transfer by USB_malloc(). Note that USB_malloc() will allocate a non-cacheable memory buffer. It then created a Control-In pipe by using usb_rcvctrlpipe macro, and the endpoint number is 0. The device driver the use the FILL_CONTROL_URB macro facility to fill the URB. The callback function is ctrl_callback(), which is provided by the device driver itself. After submitting the URB, the caller task suspend on waiting the <pegasus->events> event set. On completion of this URB, the USB system software will invoke ctrl_callback(), and ctrl_callback() will set the <pegasus->events> event to wake up the caller task.

3.3 Bulk Transfer

IN this section, we will introduce how to make bulk transfers by URBs. The URB provided <**transfer_buffer**> and <**transfer_buffer_length**> to accommodate data to be transferred to or from device. The direction of transfer is determined by the direction bit of bulk pipe. The transfer length is unlimited. If you are familiar with OpenHCI specification, you may understand that the

maximum transfer size of a bulk transfer is 4096 bytes. If the transfer length of your URB exceeds 4096 bytes, the USB system software will split it into several transfer units smaller than 4096 bytes. Thus, you can specify unlimited transfer buffer length, only the physical memory can limit the size.

The transfer buffer must be non-cacheable. A designer can use **USB_malloc()** to acquire a block of non-cacheable memory.

The USB device driver also has to prepare a callback function to be invoked by the USB system software. The callback function will be invoked on the completion of URB, in spite of success or fail. Generally, the callback function is responsible for waking up the task that delivered the URB. The callback function may also check the status of the URB to determine the transfer is successful or not. The following is an example of bulk transfer.

```
/* In Host Controller HISR context */
static VOID write bulk callback(URB T *urb)
                     *pegasus = urb->context;
    PEGASUS T
    STATUS
                     previous int value;
    DV DEVICE ENTRY *device;
    PegasusDevice->tx ready = 1;
    /* Get a pointer to the device. */
    device = DEV Get Dev By Name("Pegasus");
    /* Lock out interrupts. */
    previous int value = NU Control Interrupts(NU DISABLE INTERRUPTS);
    DEV Recover TX Buffers (device);
    /* If there is another item on the list, transmit it. */
    if (device->dev transq.head)
        /* Re-enable interrupts */
        NU Control Interrupts (previous int value);
        /* Transmit the next packet. */
        PegasusTransmit(device, device->dev transq.head);
    }
    /* Re-enable interrupts. */
```

```
NU Control Interrupts (previous int value);
    if (urb->status)
       USB printf("write bulk callback - TX error status: d\n",
                   urb->status);
}
STATUS PegasusTransmit(DV DEVICE ENTRY *dev, NET BUFFER *netBuffer)
{
    INT
           ret, wait=0;
           *buf ptr;
   UINT8
    INT
          totalLength = 0;
    while (! PegasusDevice->tx ready)
       NU Sleep(1);
                                      /* wait on any outgoing Tx */
        if (wait++ > NU PLUS Ticks Per Second)
            USB printf("Can't transmit packet!\n");
            return NU IO ERROR;
        }
    }
    buf ptr = PegasusDevice->tx buff + 2;
    do
    {
       memcpy(buf ptr, netBuffer->data ptr, netBuffer->data len);
       totalLength += netBuffer->data len;
       buf ptr += netBuffer->data len;
        /* Move on to the next buffer. */
        netBuffer = netBuffer->next buffer;
    } while (netBuffer != 0);
    /* The first two bytes record the packet length. */
    buf ptr = PegasusDevice->tx buff;
   buf ptr[0] = totalLength & 0xff;
    buf ptr[1] = (totalLength >> 8) & 0xff;
```

3.4 Interrupt Transfer

IN this section, we will introduce how to make interrupt transfers by URBs. The URB provided <**transfer_buffer**> and <**transfer_buffer_length**> to accommodate data to be transferred to or from device, and <**interval**> to specify polling interval of the interrupt transfer. The direction of transfer is determined by the direction bit of interrupt pipe. The transfer length is dependent on target interrupt endpoint.

The transfer buffer must be non-cacheable. A designer can use **USB_malloc()** to acquire a block of non-cacheable memory.

The USB device driver also has to prepare a callback function to be invoked by the USB system software. The callback function will be invoked if there's data received in one of the interrupt interval. In the callback function, USB device driver can read <**transfer_buffer**> to retrieve received interrupt data. The USB device driver have not to modify URB or resend URB. The USB library will resend the interrupt URB after callback. The interrupt URB will not stop until hardware failure or explicitly deleted by the USB device driver.

```
static VOID intr_callback(URB_T *urb) {
```

```
PEGASUS_T *pegasus = urb->context;
UINT8 *d;
if (!pegasus)
   return;
switch (urb->status)
    case USB ST NOERROR:
       break;
    case USB ST URB KILLED:
        return;
    default:
        break;
}
d = urb->transfer buffer;
if (d[2] & 0x1)
   UART printf("Rx error - overflow!!\n");
FILL_INT_URB(&_PegasusDevice->intr_urb, _PegasusDevice->usb,
             usb rcvintpipe( PegasusDevice->usb, 3),
             (CHAR *) & PegasusDevice->intr buff[0], 8,
             intr_callback, _PegasusDevice,
            _PegasusDevice->intr_interval);
res = USB SubmitUrb(& PegasusDevice->intr urb);
if (res)
   UART printf("pegasus open - failed intr urb %d\n", res);
```

4. USB Library Provided API

❖ InitUsbSystem

Prototype	INT InitUsbSystem (VOID)
Description	Initialize the USB hardware and USB core library. This function must be invoked before any other functions. The USB library will scan device at this time, but the device will not be activated until the corresponding device driver was registered by USB_RegisterDriver().
Input	None
Output	None
Return	0 - Success Otherwise - Failure
See also	
Example code	/* * Initialize USBD, HC driver, hub driver, and register all other * USB device drivers. */ InitUsbSystem(); UMAS_InitUmasDriver(); UsbPrinter_Init();

USB_RegisterDriver

Prototype	INT USB_RegisterDriver (USB_DRIVER_T *driver)
Description	Register a device driver with the USB library. In this function, USB library will also try to associate the newly registered device driver with all connected USB devices that have no device driver associated with it. Note that a connected USB device can be detected by USB library but may not work until it was associated with its corresponding device driver.
Input	<pre><driver> - The USB device driver to be registered with USB core library</driver></pre>
Output	None
Return	0 - Success Otherwise - Failure
See also	USB_DeregisterDriver
Example code	<pre>static USB_DRIVER_T usblp_driver = { "usblp", usblp_probe, usblp_disconnect, {NULL, NULL}, {0}, NULL, usblp_ids, NULL, NULL }; INT UsbPrinter_Init() { if (USB_RegisterDriver(&usblp_driver)) return -1; return 0; }</pre>

NO: USB Host Core Library VERSION: 1.0 PAGE: 32

USB_DeregisterDriver

Prototype	VOID USB_DeregisterDriver(USB_DRIVER_T *driver)
Description	Deregister a device driver
Input	<pre><driver> - The device driver to be deregistered</driver></pre>
Output	None
Return	0 - Success Otherwise - Failure
See also	USB_RegisterDriver
Example code	<pre>VOID UsbPrinter_Exit() { USB_DeregisterDriver(&usblp_driver); }</pre>

NO: USB Host Core Library VERSION: 1.0 PAGE: 33	NO:	USB Host Core Library	VERSION:	1.0	PAGE:	33
---	-----	-----------------------	----------	-----	-------	----

❖ *USB_AllocateUrb*

Prototype	URB_T *USB_AllocateUrb(INT iso_packets)
Description	Creates an urb for the USB driver to use and returns a pointer to it. The driver should call USB_FreeUrb() when it is finished with the urb.
Input	<pre><iso_packets> - The number of isochronous frames in a single URB. For other transfer types, this value must be zero.</iso_packets></pre>
Output	None
Return	NULL - Failure Otherwise - A pointer to the newly allocated URB
See also	USB_FreeUrb, USB_SubmitUrb, USB_UnlinkUrb
Example code	_W99683_Camera->sbuf[i].urb = USB_AllocateUrb(FRAMES_PER_DESC); if (_W99683_Camera->sbuf[i].urb == NULL) { UART_printf("%s - USB_AllocateUrb(%d.) failed. \n", proc,

NO: USB Host Core Library	VERSION:	1.0	PAGE:	34
---------------------------	----------	-----	-------	----

❖ USB_FreeUrb

Prototype	VOID USB_FreeUrb(URB_T *urb)	
Description	Frees the memory used by a urb	
Input	<urb> - pointer to the URB to free</urb>	
Output	None	
Return	None	
See also	USB_AllocateUrb, USB_SubmitUrb, USB_UnlinkUrb	
Example code		

USB_SubmitUrb

Prototype	INT USB_SubmitUrb(URB_T *urb)
Description	Submit a URB for executing data transfer
Input	<pre><urb> - Pointer to the URB to be serviced</urb></pre>
Output	None
Return	0 - Success Otherwise - Failure
See also	USB_AllocateUrb, USB_FreeUrb, USB_UnlinkUrb
Example code	<pre>/* prepare URB */ FILL_BULK_URB(&_PegasusDevice->tx_urb, _PegasusDevice->usb,</pre>

USB_UnlinkUrb

Prototype	INT USB_UnlinkUrb(URB_T *urb)
Description	Unlink a URB which has been submitted but not finished
Input	<pre><urb> - pointer to the URB to be unlinked</urb></pre>
Output	None
Return	0 - Success Otherwise - Failure
See also	USB_AllocateUrb, USB_FreeUrb, USB_SubmitUrb
Example code	<pre>INT PegasusClose() { _PegasusDevice->flags &= ~PEGASUS_RUNNING; if (!(_PegasusDevice->flags & PEGASUS_UNPLUG)) disable_net_traffic(_PegasusDevice); USB_UnlinkUrb(&_PegasusDevice->rx_urb); USB_UnlinkUrb(&_PegasusDevice->tx_urb); USB_UnlinkUrb(&_PegasusDevice->trl_urb); #ifdef PEGASUS_USE_INTR USB_UnlinkUrb(&_PegasusDevice->intr_urb); #endif return 0; }</pre>

$\red{ \ } \textit{USB_SendControlMessage}$

Prototype	INT USB_SendControlMessage(USB_DEV_T *dev, UINT32 pipe, UINT8 request,
Description	Builds a control urb, sends it off and waits for completion. This function sends a simple control message to a specified endpoint and waits for the message to complete, or timeout. Don't use this function from within an interrupt context.
Input	<pre></pre>
Output	None
Return	0 - Success Otherwise - Failure
See also	USB_SendBulkMessage
Example code	<pre>dma_data = USB_malloc(len, BOUNDARY_WORD); retval = USB_SendControlMessage(usblp->dev,</pre>

	110011 10 13	\/===01011	4.0	5405	00
NO:	USB Host Core Library	VERSION:	1.0	PAGE:	38

USB_SendBulkMessage

Prototype	INT USB_SendBulkMessage(USB_DEV_T *dev, UINT32 pipe, VOID *data, INT len, INT *actual_length, INT timeout)
Description	Builds a bulk urb, sends it off and waits for completion. This function sends a simple bulk message to a specified endpoint and waits for the message to complete, or timeout. Don't use this function from within an interrupt context.
Input	<pre></pre>
Output	None
Return	0 - Success Otherwise - Failure
See also	USB_SendControlMessage
Example code	<pre>if (!pb->pipe) pipe = usb_rcvbulkpipe (s->usbdev, 2); else pipe = usb_sndbulkpipe (s->usbdev, 2); ret = USB_SendBulkMessage(s->usbdev, pipe, pb->data, pb->size, &actual_length, 100); if (ret<0) { err("dabusb: usb_bulk_msg failed(%d)", ret); if (usb_set_interface (s->usbdev, _DABUSB_IF, 1) < 0) { err("set_interface failed"); return -EINVAL; } }</pre>

❖ USB_malloc

Prototype	VOID *USB_malloc(INT wanted_size, INT boundary)	
Description	Allocate a non-cacheable memory block started from assigned boundary. The total size of the USB library managed memory block is 256KB.	
Input	<pre><wanted_size> - The wanted size of non-cacheable memory block <boundary> - The start address boundary of the memory block. It cab be</boundary></wanted_size></pre>	
Output	None	
Return	NULL - Failed, there is not enough memory or USB library is not started Otherwise - pointer to the newly allocated memory block	
See also	USB_free	
Example code	<pre>UINT8 *dma_data; dma_data = USB_malloc(len, BOUNDARY_WORD); if (dma_data == NULL) { NU_printf("usblp_ctrl_msg - Memory not enough!\n"); return -1; } retval = USB_SendControlMessage(usblp->dev, dir ? usb_rcvctrlpipe(usblp->dev, 0) : usb_sndctrlpipe(usblp->dev, 0), request, USB_TYPE_CLASS dir recip, value, usblp->ifnum, dma_data, len, HZ * 5); memcpy(buf, dma_data, len); USB_free(dma_data);</pre>	

NO: USB Host Core Library	VERSION:	1.0	PAGE:	40
---------------------------	----------	-----	-------	----

USB_free

Prototype	VOID USB_free(VOID *alloc_addr)	
Description	Free the memory block allocated by USB_malloc()	
Input	<pre><alloc_addr> - pointer to the USB_malloc() allocated memory block to be freed</alloc_addr></pre>	
Output	None	
Return	None	
See also	USB_malloc	
Example code	See USB_malloc()
